ZERO SERVERS. ABOUT ZERO DOLLARS. WHOLE GAME ONLINE.

How The Elden Cube travels from an idea to your browser: built with Kiro, hosted on AWS.

① BUILD

AI IDE

Kiro

The AI teammate: spec → design → tasks → code.

writes the code

BUILD TOOL

Vite

Packs the game into tiny static files.

static files

② DEPLOY

INFRA AS CODE

AWS CDK

~100 lines of TypeScript = the whole cloud.

cdk deploy

IaC ENGINE

CloudFormation

Reads the blueprint. Builds it all.

builds

③ HOST ON AWS

AWS Cloud · files in Singapore (ap-southeast-1), served worldwide

STORAGE

Amazon S3

A private vault for the game files.

OAC

CDN

CloudFront

Served fast from an edge near you. HTTPS only.

SECURITY · OAC

The Lock

Only CloudFront holds the key.

COST GUARDRAIL

AWS Budgets

A USD 5 alarm emails us before the bill bites.

HTTPS

④ PLAY

PLAY

Your Browser

The game runs 100% on your laptop.
No login. No data stored.

REQUEST JOURNEY

What happens when you open the link

1. **You open the link** — any desktop browser
2. **A nearby CloudFront edge** — answers over HTTPS
3. **S3, through the lock** — only on a cache miss
4. **The game loads once** — code · sounds · music · font
5. **You play** — 0 cloud calls while you play

Files are cached at the edge, so most visits never touch S3 at all.
