The Elden Cube — AWS Architecture

A clumsy 3D boss-fight browser game, planned and built with **Kiro** and hosted on **AWS** as a static website.

What is it?

The Elden Cube is a funny parody of a souls-like boss fight. A clumsy hero swings an oversized sword at a giant crowned jelly cube in a moonlit stone ruin.

- 3 HP and 3 flasks vs a 36-HP boss with 8 moves
- Rage at half HP: blood moon + meteor shower
- Runs in any browser, no install, no login

Why this design?

- **About USD 0 / month**: static files only, covered by the free allowance
- **Safe**: no servers or APIs at runtime, so nothing to break or abuse
- **Secure**: private bucket, readable only through CloudFront (OAC), HTTPS
- **Repeatable**: one command deploys (*cdk deploy*), one removes all (*cdk destroy*)
- **Guarded**: AWS Budgets alert at USD 5
